

Assignment 1: S3 Public Static Image Hosting

Student Name: Chakshu Sharma

RTU Roll Number: 23EACAD030.

Step 1: Bucket Creation & Configuration

First, a unique storage bucket named `chakshu-public-live-images` was created in the Amazon S3 Console. During provisioning, the **"Block all public access"** constraint was unchecked, and **ACLs were explicitly enabled** to allow public interactions. Following this, the media asset (Stefan and Damon Salvatore.jpg) was successfully uploaded into the directory root.

Step 2: Object Permissions & Live URL Verification

Once the image was uploaded, fine-grained access controls were adjusted under the object's permissions tab. Dynamic read access was granted to Everyone (public access) by checking the Objects (Read) box. The asset became globally live instantly, which was verified by launching the secure S3 Object URL string seamlessly inside a public browser window. <https://chakshu-public-live-images.s3.ap-south-1.amazonaws.com/Stefan+and+Damon+Salvatore.jpg>
