

Assignment 3: Automated Image Thumbnail Generation using AWS Lambda

Student Name: Chakshu Sharma

RTU Roll Number: 23EACAD030

Step 1: Source Bucket Upload & Trigger Ingestion

First, an input storage bucket named *chakshu-images-source* was configured to act as the event trigger source. A high-definition image file (Stefan and Damon Salvatore.jpg) with an original storage size of **77.4 KB** was successfully uploaded to this bucket root layer.

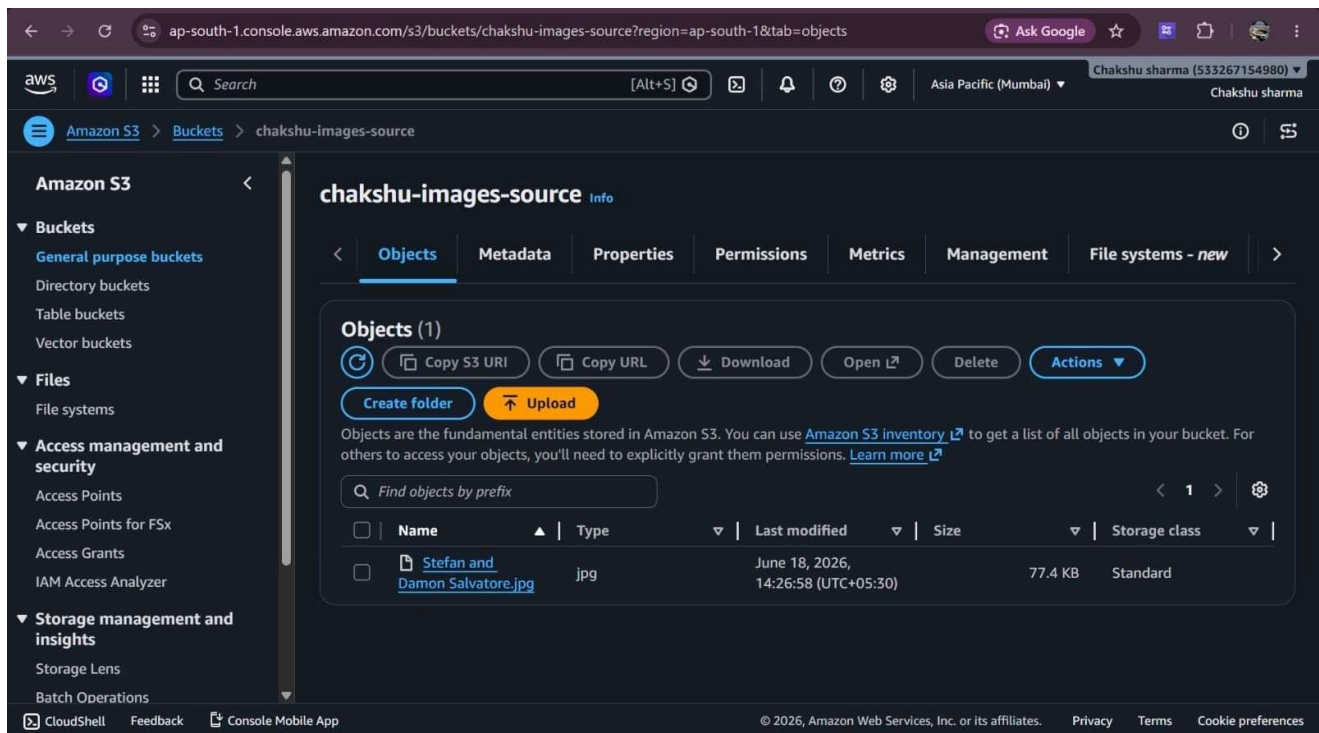

Fig 1: Original Image Uploaded in Source Bucket

Step 2: Lambda Processing & Destination Folder Verification

Upon upload, an automated AWS Lambda function was instantly triggered via S3 event notifications. The serverless function successfully processed, resized, and compressed the image payload. The final compressed thumbnail file of size **6.6 KB** was automatically generated and saved inside the `thumbnails/` folder of the target destination bucket *chakshu-images-destination*.
